

Started with nothing but 2D blueprints and designed a complete F1 helmet from scratch — just as a challenge.

This short journey taught me advanced surfacing, debossing, shelling, and surface lofting. Here's what went into it:

- **Main Body** — Getting the main surface right taught me how to handle complex geometry and set the path for everything that came after.
- **Debossing** — Debossed the surface to reflect real aerodynamic flow. Sounds simple, but it matters more than you'd think.
- **Visor & Base Gasket** — Had to be just right — proper shape, correct tolerances, and clear sightlines. The gasket taught me how two parts actually meet in the real world.
- **Mouthpiece & Vents** — Pushed me to think about ergonomics, organic shapes, and controlled airflow in very tight spaces.
- **Helmet Spoiler** — Designed to cut through air and reduce drag. Pure aerodynamic surfacing — one of the more fun pieces.
- **Seatbelt Mount** — Driver safety comes first in motorsport.
- **Livery** — Applying materials, textures, and a full livery made the whole thing feel real. It reminded me how much presentation matters.
